Removal of NO_x from flue gases in pelletizing plants – evaluation of two possible alternatives

- NO_x emissions contribute to ground level ozone, acidification and eutrophication.
- How to reduce NO_x emissions from pelletizing plants is not well investigated.
- In this work, SCR and LoTOx technologies were evaluated and compared.
- SCR interesting in some cases, but would have high investment cost and energy consumption in some cases.
- More knowledge is needed before LoTOx installation can be recommended.

Thank you!
